

**Camp Lake Hubert has implemented our most advanced program.**

### Tick Population Measurements

Tests are conducted in the event of a population flare up to measure tick population levels. The data gathered helps determine where ticks are most concentrated which allows us to implement a more effective and targeted control program and monitor population reductions.

### Host-Oriented Tick Control

Rodent & Chipmunks generally transmit Lyme disease to ticks which is later passed to humans. We have strategically installed devices which treat rodents fur with a liquid to prevent ticks from hosting. The process is similar to flea & tick medication applied to pets & does not harm the rodent. This method shifts rodents from infecting ticks with disease to instead exterminating ticks. Yes, the chipmunks & mice here help control ticks.

### Tick Population Lab Analysis

Collected ticks are laboratory tested to determine if any are infected with diseases such as Lyme & similar illnesses allowing us to monitor infection rates.

### Perimeter Treatment Zone

The neon yellow lines represent our perimeter treatment zone that we inspect monthly for poison ivy, mosquito breeding activity, and proactively treat for control. This established a protective barrier surrounding activity areas where threats are suppressed.

Ivy Oaks is a public health control company servicing large commercial areas. All products used are EPA approved for recreation areas. While our program achieves a very high level of control we cannot guarantee 100% of ticks, mosquitoes and poison ivy will be eliminated in such large areas.

### Mosquito Abatement

We survey the entire property for stagnant water bodies which are analyzed for mosquito breeding. All potential breeding zones are monitored while active breeding zones are treated with a natural product for control.
